# Project Description

## Brief Summaries of the Report

In this project, we have used SQL to create a database on Instagram user metrics. The database contains information on user activity, such as the number of posts they have made, the number of likes they have received, and the hashtags they have used. We have used MySQL to derive insights from the data and answer the various questions of the problem statement.

The data-backed insights gained for both marketing and investor metrics issues have been explained in this report in an informative and concise manner.

# Approach

## Part Two

- **Section 1: Data Collection and Database Creation:** We began by designing a relational database comprising seven tables to store diverse information about the 100 Instagram users. These tables encompassed data on user metrics such as likes, follows, hashtags, and account creation details.
- **Section 2: Problem Statements and Significance:** The identified problem statements play a crucial role in improving the user experience on Instagram and addressing investor inquiries. By effectively addressing these problem statements, we can enhance the platform's functionality, user engagement, and investor confidence.

# Approach

## Part Two

- Section 3:

We employed various SQL queries to explore and analyze the collected data. These queries provided us with meaningful insights into user behavior, engagement patterns, and other key metrics. Throughout the report, we will present and explain these queries along with their corresponding findings.

- Section 4: Results and Recommendations:

Based on our analysis, we have identified significant patterns, trends, and correlations within the Instagram user metrics. These findings shed light on user preferences, content engagement, and account creation trends, among other valuable insights.

# Tech-Stack Used

---

## MySQL Workbench

SQL Workbench played a pivotal role in our data analysis process, offering a comprehensive set of capabilities that facilitated the extraction of insights and the derivation of meaningful conclusions from our dataset. This powerful tool provided us with several advantages, making it an ideal choice for our analytical tasks.

SQL Workbench provided us with a robust and user-friendly environment for data manipulation, analysis, and visualization. Its powerful features, including advanced querying capabilities, data visualization options, analytical functions, efficient data management, and scalability, significantly contributed to our ability to generate valuable insights and draw meaningful conclusions from the Instagram user metrics dataset.

# Insights

Part Four

## Overall User Insights

100

Users

257

Photos

13

Bots

## All Post Insights

21

Hashtags

7623

Follows

8782

Likes

7488

Comments

# Result

Part Five

## A) Marketing:

### 1.Rewarding Most Loyal Users:

People who have been using the platform for the longest time.

SQL Query Used:

```
SELECT * FROM users  
ORDER BY created_at  
LIMIT 5
```

```
1  /* Most Loyal User */
2  •  use ig_clone;
3  •  select * from users
4      order by created_at
5      limit 5
```

	id	username	created_at
▶	80	Darby_Herzog	2016-05-06 00:14:21
	67	Emilio_Bernier52	2016-05-06 13:04:30
	63	Elenor88	2016-05-08 01:30:41
	95	Nicole71	2016-05-09 17:30:22
	38	Jordyn.Jacobson2	2016-05-14 07:56:26
*	NULL	NULL	NULL

# A) Marketing:

## 2. Remind Inactive Users to Start Posting:

Find the users who have never posted a single photo on Instagram

SQL Query Used:

```
SELECT username FROM users  
LEFT JOIN photos ON  
users.id = photos.user_id  
WHERE photos.id is NULL;
```

```
1  /* Inactive Users */
2  • select * from photos;
3  • select * from users;
4  • select username from users;
5  • select username from users LEFT JOIN photos on users.id = photos.user_id where photos.id is NULL;
```

Result Grid	Filter Rows:	Export:	Wrap Cell Content:
username

# A) Marketing:

## 3. Declaring Contest Winner:

Identify the winner of the contest and provide their details to the team

SQL Query Used:

```
SELECT * FROM likes;  
SELECT photo_id, COUNT(photo_id) as  
count_value  
FROM likes  
GROUP BY photo_id  
ORDER BY count_value desc;  
SELECT id, user_id FROM photos  
WHERE id = 145;  
SELECT username FROM users  
WHERE id = 52;
```

```
1  /* Contest Winner (most likes on single photo) */  
2  •  select * from likes;  
3  •  select photo_id, count(photo_id) as count_value  
4      from likes  
5      group by photo_id  
6      order by count_value desc;  
7  /* photo_145 has most likes (48) */  
8  •  select id, user_id from photos  
9      where id = 145;  
10 /* photo_id 145 was posted by user 52 */  
11 •  select username from users  
12     where id = 52;  
13 /* Zack_Kemmer93 is the username of user 52 */
```

Result Grid	Filter Rows:	Export:	Wrap Cell Content:
username			
▶ Zack_Kemmer93			

# A) Marketing:

## 4. Hashtag Researching:

Identify and suggest the top 5 most commonly used hashtags on the platform

SQL Query Used:

```
SELECT tags.tag_name,COUNT(*)  
AS tag_count  
FROM photo_tags  
JOIN tags ON photo_tags.tag_id =  
tags.id  
GROUP BY tags.id  
ORDER BY tag_count DESC  
LIMIT 5;
```

```
1  /* 5 most commonly used hashtags */  
2  • select * from tags;  
3  • SELECT * from photo_tags;  
4  • SELECT count(photo_id) from photo_tags;  
5  • select photo_id, count(*) from photo_tags  
6    group by photo_id;  
7  • SELECT tags.tag_name,COUNT(*) AS tag_count  
8    FROM photo_tags  
9    JOIN tags ON photo_tags.tag_id = tags.id  
10   GROUP BY tags.id  
11   ORDER BY tag_count DESC  
12   LIMIT 5;
```

Result Grid	Filter Rows:	Export:	Wrap Cell Content:	Fetch rows
tag_name	tag_count			
smile	59			
beach	42			
party	39			
fun	38			
concert	24			

# A) Marketing:

## 5. Launch AD Campaign:

The team wants to know, which day would be the best day to launch ADs.

SQL Query Used:

```
SELECT WEEKDAY(created_at)  
as weekday,  
COUNT(users.username) as  
num_users FROM  
ig_clone.users  
GROUP BY weekday  
ORDER BY num_users DESC
```

```
1  -- Most Active Weekday
2  • select * from users;
3  • select weekday(created_at) as weekday,
4    count(users.username) as num_users from ig_clone.users
5    group by weekday
6    order by num_users DESC
```

	weekday	num_users
▶	3	16
	6	16
	4	15
	1	14
	0	14
	2	13
	5	12

Weekday 3 corresponds to THURSDAY, therefore thursday would be the best day to launch ADs

# A) Investor Metrics:

## 1. User Engagement:

Provide how many times does average user posts on Instagram. Also, provide the total number of photos on Instagram/total number of users

```
1 • use ig_clone;
2 -- How many times does average user posts on Instagram
3 • SELECT user_id , COUNT(id)AS COUNTS FROM photos
4 GROUP BY user_id;
5
```

user_id	COUNTS
1	5
2	4
3	4
4	3
6	5
8	4
9	4
10	3
11	5
12	4
13	5
15	4
16	4
17	3
18	1

```
6 -- The Total Number Of Photos on Instagram
7 • select count(id) as
8 'Total Photos' from photos;
```

Total Photos
257

```
10 -- Total Number of Users
11 • select count(id) as 'Total Users' from users;
12
```

Total Users
100

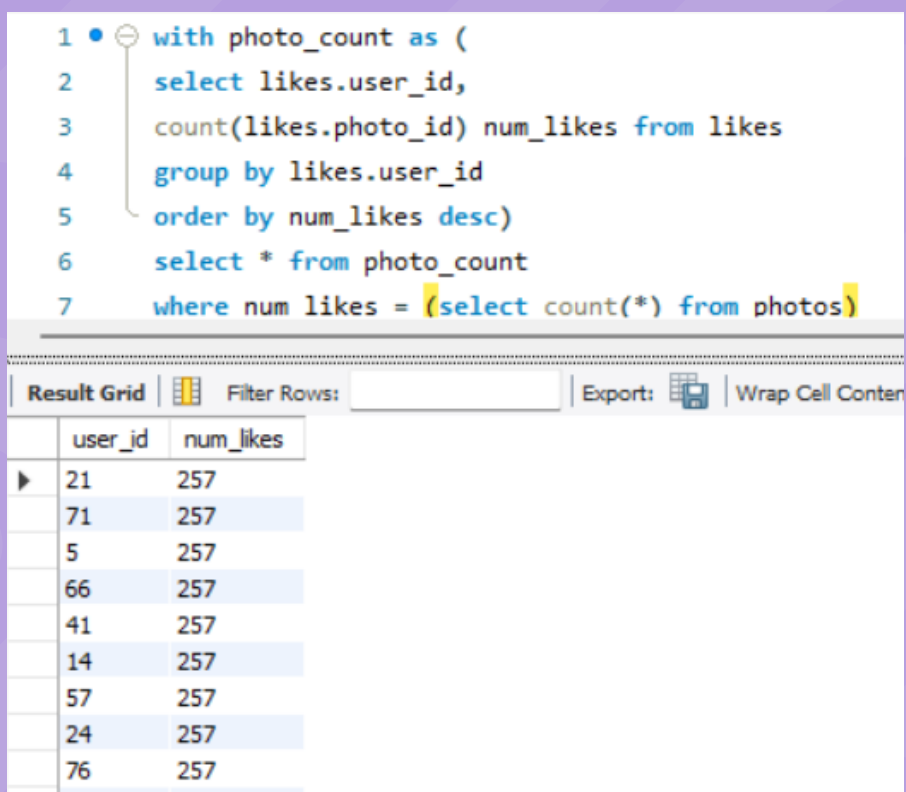

# A) Investor Metrics:

## 2. Bots & Fake Accounts:

The investors want to know if the platform is crowded with fake and dummy accounts

SQL Query Used:

```
WITH photo_count as (  
SELECT likes.user_id,  
COUNT(likes.photo_id) num_likes  
FROM likes  
GROUP BY likes.user_id  
ORDER BY num_likes desc)  
SELECT * FROM photo_count  
WHERE num_likes = (SELECT  
COUNT(*) FROM photos);
```

```
1 with photo_count as (  
2   select likes.user_id,  
3   count(likes.photo_id) num_likes from likes  
4   group by likes.user_id  
5   order by num_likes desc)  
6   select * from photo_count  
7   where num_likes = (select count(*) from photos)
```

	user_id	num_likes
▶	21	257
	71	257
	5	257
	66	257
	41	257
	14	257
	57	257
	24	257
	76	257
	--	---

# Conclusion

- The findings of the analysis provide valuable insights into how users are interacting with Instagram. For example, we found that the most active users are those who have been using the platform for the longest time. We also found that there are a significant number of bots on Instagram, which could be impacting the platform's overall engagement metrics.
- 
- The findings of the analysis can be used to inform marketing campaigns and investment decisions. For example, the marketing team could use the findings to target their campaigns to the most active users. The investor team could use the findings to assess the platform's overall health and growth potential.
- 
- The analysis was limited by the quality of the data. The data was incomplete and inaccurate in some areas. This limited the insights that could be gained from the analysis. However, the findings of the analysis are still valuable and can be used to inform marketing campaigns and investment decisions.
